

Customer Journey Map

Date	27 June 2026
Team ID	
Project Name	A comprehensive measure of well being
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1: Data Input & Country Selection	Stage 2: Prediction & Analysis	Stage 3: Review, Comparison & Decision
Actions <i>What does the customer do?</i>	- Opens the HDI prediction web application. - Selects a country or enters values for life expectancy, education, and GNI per capita. - Reviews the entered indicator values before submitting.	- Submits the indicators to the trained ML model via the Flask backend. - Waits while the system processes and classifies the HDI tier. - Views the predicted HDI score and classification (Very High/High/Medium/Low).	- Compares the predicted HDI tier against other countries or past data. - Downloads or shares the report/insights with stakeholders. - Uses the insights to identify development gaps and prioritize action.
Touchpoint <i>What part of the service do they interact with?</i>	- Flask web application input/landing page. - Form fields for life expectancy, schooling years, and GNI per capita. - Country search or selection dropdown.	- Flask API endpoint connecting to the Scikit-learn model. - Results page displaying the predicted HDI score and tier. - Matplotlib/Seaborn visualizations showing the indicator breakdown.	- Comparison dashboard across multiple countries. - Export/download or share button for the report. - Summary insights and recommendations section.
Customer Thought <i>What is the customer thinking?</i>	"Are these the right indicators to judge development?" "I hope the data I'm entering is accurate and current." "This interface looks simple, I can find what I need quickly."	"Is this prediction reliable and based on solid data?" "How does this compare to the country's actual global HDI ranking?" "Which indicator affected the score the most?"	"Which indicator needs the most improvement here?" "This gives me a clear basis to justify a policy recommendation." "I can use this to communicate urgency to leadership."

Customer Feeling <i>What is the customer feeling?</i>	• Curious about the process. • Slightly cautious about data accuracy. • Hopeful the tool will be easy to use.	• Anticipation while waiting for the result. • Reassured if the prediction matches expectations. • Growing confidence in the tool's reliability.	• Confident and well-informed. • Motivated to act on the insights. • Satisfied that the tool simplified decision-making.
Process Ownership <i>Who is in the lead on this?</i>	End user (policymaker/researcher), sourcing data from government and international databases.	Development team — data science and backend engineers maintaining the ML model and Flask application.	End user / decision-maker, who interprets the output and takes it forward for policy or research action.
Opportunities <i>How can we improve this stage?</i>	• Autofill indicators from live UNDP/World Bank datasets to cut manual entry errors. • Add tooltips explaining each indicator for first-time users. • Allow bulk upload of multiple countries via CSV.	• Show a confidence score alongside the predicted HDI tier. • Add explainability (e.g., feature importance) so users understand what drove the score. • Reduce prediction latency for a smoother experience.	• Add multi-country comparison charts and exportable PDF reports. • Enable historical trend tracking to see HDI progress over years. • Provide policy recommendation templates based on the weakest indicator.
